Manchester United 2021: Solving the Wrong Problem

A data-led counterfactual on output vs control in squad-building decisions

APPLICATION MEMO
FOOTBALL DATA ANALYSIS
KARAN MOZA

1. THE DIAGNOSIS

In 2021, Manchester United added Cristiano Ronaldo to increase attacking output. But the underlying data suggests the team's more urgent issue was not chance creation. It was control: midfield stability, defensive transitions, and the ability to protect the back line.

> **United did not buy the wrong player as much as they bought the wrong solution. United added output when they needed control.**

2. EVIDENCE SNAPSHOT

	2020/21	2021/22
POINTS	74	58
XG DIFF / MATCH	+0.56	+0.01
XGA / MATCH	1.10	1.50
SHOTS AGAINST / MATCH	11.37	13.47

The decline was not only a table-position story: United lost most of their underlying xG cushion while conceding more chance quality and shot volume.

3. MODEL APPROACH

Using public match-level Premier League data, I modeled United's attacking and defensive profile through goals, xG, xGA, shots for, and shots against. A Poisson goal simulation then estimated win/draw/loss probabilities under alternative team profiles.

The counterfactual assumes no Ronaldo signing, with a control-oriented midfielder improving defensive stability and shot suppression.

This is a transparent scenario model, not causal proof.

4. COUNTERFACTUAL RESULT

2021/22 Points Scenario. Control improves the expected points profile, but does not transform the team.

The team tried to raise its ceiling, but failed to protect its floor.

Analytical caution: This is a directional scenario model. The uplift depends on assumptions, but the diagnosis remains stable across mild/base/strong cases.

5. REQUIRED MIDFIELDER PROFILE

A control-oriented midfielder should:

- receive under pressure
- progress play safely
- reduce central transition exposure
- protect rest defence
- improve territorial stability
- prevent defensive duels before they happen

> **The next signing should not only win duels. It should prevent some of them from happening.**

6. DECISION TAKEAWAY

> **Before buying output, diagnose the constraint.**

Data should not just measure performance after the fact; it should help define the problem before capital is deployed.
